- To pivot into a new/related IT field and gain hands-on knowledge, study for job-like position and prepare for career ready environment
- To pivot into a new/related IT field and gain hands-on knowledge, study for job-like position and prepare for career ready environment
- I originally signed up for Network+ because I wanted to build a strong foundation in networking and IT while preparing for a career in cybersecurity. I understood that networking is a core skill for cybersecurity professionals, and I wanted to develop a deeper understanding of how systems communicate, how networks are designed, and how to troubleshoot issues.

Since starting the program, my goals have become more focused. I am now specifically working toward a career as a SOC Analyst or Cybersecurity Analyst. The program has reinforced the importance of networking knowledge in cybersecurity and has helped me gain the technical skills needed to pursue opportunities in the field. My overall goal of entering cybersecurity has remained the same, but I now have a clearer understanding of the path I want to take.

- I signed up for the program, to get a more of a community and dialogue about this topic rather than only the solo learning experience. Hearing how someone solved a problem in real time and being able to ask why they chose that route versus another path, allows me to broaden the way I myself solve breaks in a system.
The program just really enhances my commitment to this career path.

- SOC Analyst, SIEM Analyst, Compliance/Governance Analyst, Data Center Security Specialist
- SOC Analyst, SIEM Analyst, Compliance/Governance Analyst, Data Center Security Specialist
- What interests me most about cybersecurity is the opportunity to protect organizations from threats while continuously learning and solving complex problems. I enjoy the investigative side of cybersecurity, such as identifying suspicious activity, analyzing incidents, and understanding how attacks occur. I am particularly interested in Security Operations Center (SOC) work because it combines monitoring, threat detection, incident response, and continuous improvement. I also appreciate that cybersecurity is a constantly evolving field that encourages lifelong learning and offers many opportunities for growth and specialization.

- Compliance and keeping everyone safe on the computer
- Compliance and keeping everyone safe on the computer
- I love that GRC is both technical and practical. I am able to understand frameworks and translate them into reasons why risks are or are not present.
- I love that GRC is both technical and practical. I am able to understand frameworks and translate them into reasons why risks are or are not present.
- Honestly, I'm most interested in digital forensics—figuring out how attacks happened, what data was compromised, and tracking down the evidence. I want to be the person who analyzes breaches post-incident, looks at packet captures in Wireshark, and figures out “how did they get in and what did they do?” There's something about being the detective who pieces together the timeline of an attack that really pulls me in. I'm also drawn to understanding how attackers think (like studying APT groups), which helps me investigate better. Plus, my ITSM background with process and documentation actually fits well with forensics, since it's all about following a method and keeping clear records of what you found.

- not any unusual schedule, just a normal work schedule from 8 - 4 pm
- From July through completion, my schedule will be focused around balancing my training program, continued cybersecurity study, and job search preparation. I plan to dedicate consistent time each week to coursework, hands-on labs, and review of networking and security concepts.

Outside of the program, I will continue working or maintaining my current responsibilities while also setting aside structured time for exam preparation, particularly for Security+ and SOC-related skills.

I will also allocate time for resume building, applying to entry-level cybersecurity roles, and participating in any workshops or cohort activities. My goal is to stay consistent and disciplined throughout the program so I can successfully complete it and transition into a SOC Analyst or cybersecurity role shortly after completion.

- I am a working parent but have the ability to multitask to simultaneous complete related responsibilities.

• My schedule's pretty consistent right now. I work my regular job at Aspen Dental during the day (standard business hours, so roughly 8-5), and I study in the evenings and on weekends. I'm already doing evening/weekend study sessions for my cybersecurity master's, so I'd just be adding this program to that routine. I'm in Houston, and I do travel between Texas and Florida a few times to stay with family, but those trips are usually planned and I can still study during them. From July through completion, I'd be dedicating probably 10-15 hours a week to this program—mornings before work when I'm freshest, evenings after work, and solid blocks on weekends. I'm not starting anything new that would conflict; I'm just continuing my current pattern of working while studying, and I've been doing it successfully for a while now.

- To be successful, I would benefit most from structured guidance, clear milestones, and consistent feedback throughout the program. Having access to mentorship or support when I encounter challenging cybersecurity or networking concepts would help me stay on track and build confidence in applying what I learn.

I would also appreciate resources that connect the coursework to real-world SOC Analyst tasks, such as hands-on labs, practice scenarios, and interview preparation guidance. Additionally, support with career development such as resume feedback and job search strategies that would be helpful as I prepare to transition into an entry-level cybersecurity role.

- I'm pretty self-motivated when it comes to studying. I've been doing evening and weekend study sessions for my master's and Code the Dream without much hand-holding, so I don't need a lot of administrative support. What I'd really value is career

connections like job leads, referrals, or people in the cybersecurity field who might be willing to chat about their roles. I'm actively hunting for SOC analyst or digital forensics positions, and having your network open would help a lot. I'd also appreciate feedback on my technical skills where someone can review my projects, tell me if I'm on the right track with forensics and SOC stuff, or point out gaps I should fill before interviews. Having regular check-ins or cohort meetups would keep me motivated since I work well when I'm not doing it alone. I'm not looking for someone to manage me. I just want access to your community and the ability to tap into your experience when I hit obstacles.

- Job placement, Financial support but without those things, I will still be successful because I need these programs and certifications. I can sacrifice everything now to be in a better position in six months.

- I am passionate to learn threat identification, secure architecture, and incident handling.

Also, I am eager to study monitoring alerts, hunting threats, and tuning detection rules to stop cyber attacks.

- I am committed to transitioning into a cybersecurity career and am fully motivated to complete this program successfully. I have been actively building my foundational knowledge in networking and security concepts and am focused on developing the practical skills needed for a SOC Analyst role.

I bring prior experience working in structured, security-focused environments, where attention to detail, following procedures, and responding to incidents were important parts of my responsibilities. I am excited to continue building on that experience and apply it in a more technical cybersecurity setting.

Overall, I am ready to stay consistent, put in the work, and take advantage of the program to reach my goal of entering the cybersecurity field.
